humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
on Nov 17, 2001 this sequence version replaced gi:16214807.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
10); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em.; EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
database can be found at
http://www.sanger.ac.uk/FOP/Chr9
croup. Further information can be found at

The present sequence encodes one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides they encode may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases of Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic sequences in samples. The presence of similar nucleic acid sequences in samples. The plypeptides may be used as antigens in the price of control of antipologies and in assays to identify modulators of

These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a cDNA of the invention.
                                                                                                                                                                                                                                                                     Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical
                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO: 134; 859pp + Sequence Listing; English

```
The present sequence encodes one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides they encode may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAF97926

arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid spequences in samples. The polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of their expression and activity.
Scimitar syndrome, Chaga's cardiomyopathy and coronary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gAlaGlnGlnCysSerAlaHisAsnAspValLysHisHisGlyGlnPheT 106

chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic blology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      416

lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range

The invention relates to novel human polynucleotides encoding proteins that share sequence similarity with animal proteins having thrombospondin repeats. NHPs are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kidney, foetal lung and gene trapped human cells. NHPs are thrombospondins useful for treating biological disorders involving angiogenesis, cancer and development and also in pharmacogenomic applications. NHPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and proteases. The present sequence is a CDNA encoding novel human protein (NHP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                     SS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel human polypeptides referred as NOV-x and their corresponding nucleic acid sequences. NOV-x collectively include NOV-1, NOV-2a and NOV-2b which are novel KIAA1233-like polypeptides, NOV-3a, NOV-3b, NOV-4a, NOV-3d which are novel strato-like polypeptides and NOV-4a, NOV-4b, NOV-4c, NOV-4c, NOV-4c and NOV-4e which are novel trypsin inhibitor-like polypeptides. NOV-x is used to identify a potential therapeutic agent that can modulate its activity and can be used for treating a pathology related to aberrant expression or aberrant physiological interactions of NOV-X. NOV-X or its DNA is used to determine the presence or predisposition to a disease associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated KIAA1233-like, STE20-like, or trypsin inhibitor-like polypeptide for diagnosing and treating pathological disorders, such as Parkinson's disease and for use in pharmacogenomics -
                                                                                                                                                                                                                                                                                                                                                                                          "Human novel KIAA1233-like protein, NOV-2a"

with altered levels of NOV-X. NOV-X, its DNA and its antibody are used to treat or prevent a pathology associated with NOV-X. The pathological states that can be treated or prevented are haematopoietic, cancer, immunological, tumour, neurodegenerative (e.g. Alzheimer's and Farkinson's disease), human immunodeficiency virus (HIV) illness and fertility disorders. NOV-X and its DNA are used in pharmacogenomics for predictive medicine. NOV-X DNA is used in gene therapy. The present sequence is a DNA encoding human novel KIAA1233-like protein, NOV-2a.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lLeuAspGlyThrArgCysTyrThrGluSerLeuAspMetCysIleSerG 155

```
that share sequence similarity with animal proteins having thrombospondin repeats. NHPs are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kidney, foetal lung and gene trapped human cells. NHPs are thrombospondins useful for treating biological disorders involving angiogenesis, cancer and development and also in pharmacogenomic applications. NHPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and proteases. The present sequence is a CDNA encoding novel human protein (NHP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel human polynucleotides encoding proteins

as

Zambrowicz

Friedrich G,

Turner CA,

The invention relates to novel human polynucleotides encoding proteins that share sequence similarity with animal proteins having thrombospondin repeats. NHPs are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kidney, foetal lung and gene trapped human cells. NHPs are thrombospondins useful for treating biological disorders involving angiogenesis, cancer and development and also in pharmacogenomic applications. NHPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and proteases. The present sequence is novel human protein (NHP) gene containing NHP open reading frame with flanking sequences.

WPI; 2000-160673/14. P-PSDB; AAY87347 New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular disease

Claim 9; Page 321-322; 327pp; English.

charactery to Associate and anticolar Associated with Teplesell Line human signal peptide-containing proteins HSPP-11 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, cartivity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, carproductive or developmental disorders, (e.g. arteriosclerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy; HSPP uncleic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antisense, cribles specific antibodies (Ab) and to screen for agonists and monitorial therapeutic agents). Ab are used to diagnose, or monitor, HSPP-related diseases (in usual immunoassays), as therapeutic demandance antagonists, in competitive drug screens, and for purification of HSPP. AAZ98109 to AAZ98242 encode AAY87224 to AAY87357 which represent the from natural sources

                                                                                                                                                                                                                                                                                                                                 The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a cDNA of the invention
                                                                                                                                                                                                                                                       isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition
                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO: 342; 859pp + Sequence Listing; English.

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated disorders. They may also be used to ancers and cellular adhesion ANZ34338, and ANY1685 to AAV41774 represent polynucleotide and polynucleotide and polynucleotide and the present
